

## WORLD PREMIERE FOR GRAIN CLOUD

*At the Agritechnica exhibition in Hanover on November 12, the app Grain Cloud is presented as Skandia Elevator's first software. It facilitates harvesting and storage as it provides a complete overview of all units and processes at the grain facility.*

The app collects information from the facility's control system and shows, among other things, the transport systems and machines that are running, estimated drying times and what crops are in which silos. Most importantly: the app will alert and send notifications if there is downtime or machine failures.

"Should the dryer cease to work in the middle of the night, one immediately gets an alarm and can fix the problem at once," says Joakim Larsson, CEO of Skandia Elevator. "It is incredibly important during the hectic harvest that everything works without problems. Grain Cloud also makes it possible to plan the work better, displays operating history and sends notifications when it is time for maintenance and service."

Grain Cloud is compatible with both Android and iOS and will be announced on Nov 12 at Agritechnica in Hanover. The app will initially be offered to a limited selection of our dealers. For more information about which, please contact Skandia Elevator.
